#### Numerical Differentiation Formulas

- In Chapter 4, Taylor's Theorem is used to derive a numerical differentiation formula that was used to approximate a derivative in a mathematical model that was developed to determine the terminal velocity of a free-falling body (a parachutist).
- Recall Taylor's Theorem (with n = 2):

$$f(x) = f(x_0) + f'(x_0)(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \frac{f'''(\xi_1)}{3!}(x - x_0)^3$$

where  $\xi_1$  lies between x and  $x_0$ .

R. Little 3/1

#### Alternative Form of Taylor's Theorem

Taylor's Theorem can also be stated in terms of a step size, h < 1, by letting  $h = x - x_0$  which implies that  $x = x_0 + h$ . Thus, Taylor's approximation becomes

$$f(x_0 + h) = f(x_0) + f'(x_0)h + \frac{f''(x_0)}{2}h^2 + \frac{f'''(\xi_1)}{6}h^3$$
 (1)

where  $\xi_1$  lies between  $x_0$  and  $x_0 + h$ .

R. Little 4/1

### Forward Difference Approximation

Solving for  $f'(x_0)$  in (1) gives

$$f'(x_0)h = f(x_0 + h) - f(x_0) - \frac{f''(x_0)}{2}h^2 - \frac{f'''(\xi_1)}{6}h^3$$
$$f'(x_0) = \frac{f(x_0 + h) - f(x_0)}{h} - \frac{f''(x_0)}{2}h - \frac{f'''(\xi_1)}{6}h^2$$

or

$$f'(x_0) \approx \frac{f(x_0 + h) - f(x_0)}{h}$$
 with error  $O(h)$ .

5/1

#### Another Form of Taylor's Theorem

Consider yet another form of Taylor, where  $x=x_0-h$ , thus  $-h=x-x_0$  and

$$f(x_0 - h) = f(x_0) - f'(x_0)h + \frac{f''(x_0)}{2}h^2 - \frac{f'''(\xi_2)}{6}h^3$$
 (2)

where  $\xi_2$  lies between  $x_0 - h$  and  $x_0$ .

R. Little 6/1

### Backward Difference Approximation

Solving for  $f'(x_0)$  in (2) gives

$$f'(x_0)h = f(x_0) - f(x_0 - h) + \frac{f''(x_0)}{2}h^2 - \frac{f'''(\xi_2)}{6}h^3$$
$$f'(x_0) = \frac{f(x_0) - f(x_0 - h)}{h} + \frac{f''(x_0)}{2}h - \frac{f'''(\xi_2)}{6}h^2$$

or

$$f'(x_0) \approx \frac{f(x_0) - f(x_0 - h)}{h}$$
 with error  $O(h)$ .

R. Little 7/1

#### Central Difference Approximation

A more accurate approximation to a first derivative can be obtained by taking a linear combination of these two Taylor Theorem approximations. Subtracting (2) from (1) gives

$$f(x_0 + h) - f(x_0 - h) = \left[ f(x_0) + f'(x_0)h + \frac{f''(x_0)}{2}h^2 + \frac{f'''(\xi_1)}{6}h^3 \right] - \left[ f(x_0) - f'(x_0)h + \frac{f''(x_0)}{2}h^2 - \frac{f'''(\xi_2)}{6}h^3 \right]$$

R. Little 8/1

### Central Difference Approximation II

$$f'(x_0) pprox rac{f(x_0+h)-f(x_0-h)}{2h}$$
 with error  $O(h^2)$ .

R. Little 9/1

#### Example 1

Use forward and central difference approximations to estimate the first derivative of

$$f(x) = -0.1x^4 - 0.15x^3 - 0.5x^2 - 0.25x + 1.25$$
 at  $x = 0.5$  using step size  $h = 0.5$ .

#### High-Accuracy Differentiation Formulas

- Still more accurate approximations to  $f'(x_0)$  can be obtained by taking linear combinations of more Taylor Theorem approximations and solving for  $f'(x_0)$ .
- FIGURES 23.1 to 23.3 on pages 656-657 in the text summarize other such formulas.

For example, Taylor Theorem approximations for each of

$$f(x_0-2h), f(x_0-h), f(x_0+2h), f(x_0+h)$$

can be used to derive the  $O(h^4)$  approximation

$$f'(x_0) \approx \frac{1}{12h} [f(x_0 - 2h) - 8f(x_0 - h) + 8f(x_0 + h) - f(x_0 + 2h)]$$

# Numerical Differentiation Formulas for Higher Derivatives

Similar techniques can be applied to find formulas for higher derivatives. For example, we can derive  $f''(x_0)$  by doing the following:

**Example:** Let n = 3 and use the following Taylor Approximations

$$f(x_0+h)=f(x_0)+hf'(x_0)+\frac{h^2}{2}f''(x_0)+\frac{h^3}{6}f'''(x_0)+\frac{h^4}{24}f^{(4)}(\xi_1)$$

and

$$f(x_0 - h) = f(x_0) - hf'(x_0) + \frac{h^2}{2}f''(x_0) - \frac{h^3}{6}f'''(x_0) + \frac{h^4}{24}f^{(4)}(\xi_2)$$

R. Little

## Numerical Differentiation Formula for $f''(x_0)$

Adding these gives:

$$f(x_0+h)+f(x_0-h)=2f(x_0)+h^2f''(x_0)+\frac{h^4}{24}\left[f^{(4)}(\xi_1)+f^{(4)}(\xi_2)\right]$$

and solving for the desired derivative  $f''(x_0)$  gives

$$f''(x_0) = \frac{f(x_0 + h) - 2f(x_0) + f(x_0 - h)}{h^2} - \frac{h^2}{24} \left[ f^{(4)}(\xi_1) + f^{(4)}(\xi_2) \right]$$

That is,

$$f''(x_0) \approx \frac{f(x_0+h)-2f(x_0)+f(x_0-h)}{h^2}$$

with a truncation error of  $O(h^2)$ .
